Infant Kicking Study

Assessing an eight-week intervention using a kicking toy for infants with Down syndrome

Become part of an important research study!

**KICKING** has been identified as an important precursor to infant walking.

Babies with Down syndrome kick **LESS** than babies without Down syndrome.

We are investigating an **AT-HOME INTERVENTION** using a kicking toy to increase kicking in babies with Down syndrome.

Participants will be able to keep the toy!

If you have a **3–5 month old infant with Down syndrome**, you and your child may be eligible to participate.

If you would like more information or have any questions, please contact the project leader, **Julia Looper, PT, PhD** at 253-879-2895, or by e-mail at jloop@pugetsound.edu
